Gary Davis & Ralph Jones

SOUND REINFORCEMENT HANDBOOK

Table of Contents

Page	Section/Subsection & Title	Page	Section/Subsection & Title
Section 1. What is a Sound System		Section 5. Sound Outdoors	
1	1.1 The audio signal	43	5.1 The inverse square law
1	1.1.1 Sound waves	44	5.1.1 Inverse square law calculations
2	1.1.2 The electrical representation of sound	45	5.2 Effects of environmental factors
2	1.1.3 Phase	45	5.2.1 Wind
3	1.1.4 Adding sine waves	46	5.2.2 Temperature gradients
4	1.2 The basic purpose of a sound system	46	5.2.3 Humidity
4	1.3 A conceptual model of a sound system	47	5.3 Feedback control
5	1.4 Input transducers	47	5.3.1 Maximum gain (available gain before feedback)
5	1.5 Output transducers	49	5.3.2 Using directional microphones and loudspeakers
6	1.6 A practical model of a sound system		
Section 2. Frequency Response		Section 6. Sound Indoors	
9	2.1 A definition	53	6.1 Boundaries
10	2.1.1 Basic specification methods	54	6.1.1 The absorption coefficient
11	2.1.2 Octave relationships and measurements	55	6.2 Standing waves
12	2.2 Frequency response of practical audio devices	56	6.2.1 Standing waves in a room
12	2.2.1 Electronic circuits and cables	57	6.3 Reverberation
14	2.2.2 Microphones	58	6.4 Critical distance
14	2.2.3 Loudspeakers	60	6.4.1 Implications for sound reinforcement
15	2.3 Voice and instrument ranges		
15	2.3.1 The speaking voice	61	Section 7. Block Diagrams
15	2.3.2 The singing voice and musical instruments	63	7.1 General discussion
16	2.3.3 Harmonics	66	7.2 Symbolic conventions
17	2.4 Effect of acoustical factors	66	7.3 Notational conventions
		67	7.4 Analysis of simple block diagrams
		70	7.5 Summation
Section 3. The Decibel, Sound Level, & Related Items.		Section 8. How to Read & Interpret Specifications	
19	3.1 What is a decibel?	71	8.1 General discussion
19	3.1.1 A mathematical definition of the dB	71	8.1.1 Why specs are not always what they seem
21	3.1.2 Relative versus absolute levels	71	8.1.2 Examples of specs that should be doubted
22	3.2 Relating the decibel to electrical signal levels	72	8.1.3 What to look for
22	3.2.1 dBm	72	8.2 Frequency response
22	3.2.2 dBu	72	8.2.1 Distinguishing frequency response, frequency range, and power bandwidth
23	3.2.3 dBv and dBv	74	8.2.2 Graphic versus printed specs
24	3.2.4 Converting dBv to dBu (or to dBm across 600 ohms)	74	8.2.3 What is a good frequency response spec?
24	3.2.5 Relating dBv, dBu and dBm to specifications	75	8.3 Noise
25	3.2.6 dBw	75	8.3.1 What is noise?
25	3.3 Relating the decibel to acoustic levels	76	8.3.2 White noise
25	3.3.1 dB SPL	76	8.3.3 Pink noise
26	3.3.2 dB PWL	77	8.3.4 Shaping the noise
27	3.4 What is rms?	78	8.3.5 EIN: a measure of mic preamplifier noise
28	3.5 Volume, level and gain	78	8.3.6 Specifying output noise
29	3.6 Loudness	80	8.3.7 Other types of noise
29	3.6.1 Equal loudness contours and phons	81	8.4 Harmonic distortion
30	3.6.2 What we can deduce from equal loudness contours	81	8.4.1 What is harmonic distortion?
31	3.6.3 Loudness compensation	82	8.4.2 Measuring harmonic distortion
		84	8.4.3 Factors affecting harmonic distortion specifications
Section 4. Dynamic Range		85	8.5 Intermodulation distortion
33	4.1 Dynamic range	85	8.5.1 Measuring IM distortion
33	4.1.1 A definition	86	8.5.2 Sources of IM distortion
33	4.1.2 The dynamic range of a typical rock concert	86	8.5.3 How much distortion is tolerable?
33	4.1.3 The electrical dynamic range of the sound system	86	8.5.4 Transient intermodulation distortion
34	4.1.4 The acoustical dynamic range of the system	87	8.6 Input and output impedances
35	4.2 Headroom	88	8.6.1 Confusion about input and output impedances
35	4.2.1 A definition	88	8.6.1.1 Output impedance
36	4.2.2 Why headroom is important	89	8.6.1.2 Input impedance
37	4.3 Manipulating dynamic range in a practical sound system	90	8.6.2 The implications of impedance mismatches
37	4.3.1 Why not build a sound system with excess dynamic range?	91	8.6.3 Impedance and frequency
37	4.3.2 What happens when the sound system is inadequate?	92	8.7 Standard operating levels
39	4.3.3 How to fit wide program dynamics into a sound system with limited dynamic range	92	8.7.1 General classification of levels
42	4.3.4 How much headroom is adequate?	93	8.7.2 Expressing the wide power range of a sound system
		94	8.7.3 How impedance relates to level specifications
		94	8.7.3.1 Power vs impedance
		94	8.7.3.2 Overloading an output

Page	Section/Subsection & Title	Page	Section/Subsection & Title
95	8.7.3.3 How the load affects output voltage	139	10.6 Wireless microphone systems
95	8.7.4 What happens when hi-fi and pro equipment mix	139	10.6.1 What is a wireless mic?
95	8.7.4.1 Hi-fi output to pro equipment input	139	10.6.2 Who uses wireless mics?
96	8.7.4.2 Pro equipment output to hi-fi input	139	10.6.3 What is the background of wireless mics?
96	8.8 Crosstalk	140	10.6.4 Radio frequencies used
97	8.8.1 What causes crosstalk?	141	10.6.5 Technical problems
97	8.8.2 Crosstalk in cables	142	10.6.6 Solutions
97	8.8.3 Specification of crosstalk	145	10.6.8 Compatibility of wireless mic systems
99	8.9 Filter slope rates and turnover frequencies	146	10.6.9 Antenna cables
100	8.10 Square wave tests	146	10.6.10 Evaluating wireless microphone systems
101	8.10.1 Oscilloscopes	147	10.6.11 Conclusions
103	8.10.2 What not to expect with square waves	148	10.6.12 Glossary of wireless microphone terms
103	8.11 Miscellany		
	Section 9. Why Ears Don't Always Correlate With Specs		
105	9.1 Different points of view	149	11.1 General discussion
105	9.1.1 Calibrated mics vs ears	152	11.2 Preamplifiers
106	9.1.2 Average ears vs "golden ears"	152	11.2.1 What are they, and what do they do?
107	9.2 Test equipment measurements vs listening tests	153	11.2.2 Impedance converters
107	9.2.1 Test signals versus program material	153	11.2.3 Phono preamps
109	9.2.2 Location and number of test microphones	154	11.3 Mixers
110	9.2.3 Dynamic range	155	11.4 Consoles
111	9.3 Static vs dynamic tests	155	11.4.1 What is a console?
112	9.4 Masking effects and equipment interaction	155	11.4.2 How mixes differ: pre & post fader considerations
	Section 10. Microphones	157	11.4.3 Panning, summing and master faders
113	10.1 Methods of transduction	162	11.5 Understanding console specifications
113	10.1.1 Dynamic	162	11.5.1 How many inputs, mixes and outputs?
113	10.1.2 Condenser	162	11.5.2 Signal-to-noise ratio
114	10.1.3 Electret condenser	164	11.5.3 Maximum voltage gain
114	10.1.4 Ribbon	165	11.5.4 Headroom
115	10.1.5 Carbon	166	11.5.5 Indicators
116	10.1.6 Piezoelectric	167	11.6 Transformer isolated versus electronically balanced inputs & outputs
116	10.2 Functional design	168	11.6.1 Transformers versus differential amps: price concerns
116	10.2.1 Hand-held	168	11.6.2 Discrete versus IC differential amps
117	10.2.2 Stand-mounting	169	11.6.3 The case for the transformer
117	10.2.3 Lavalier	170	11.6.4 Transformers and AC safety
118	10.2.4 Contact pickup	170	11.6.5 More on transformers
118	10.2.5 Pressure response	172	11.7 Gain staging and gain structure
119	10.2.6 Shotgun	172	11.7.1 Why does gain have to be manipulated? a review of sound levels fed to the console
119	10.2.7 Parabolic	173	11.7.2 Gain control at the microphone input
120	10.2.8 Multi-element arrays	173	11.7.3 Input attenuation or padding
120	10.2.9 Noise cancelling microphones	174	11.7.4 Eliminating other causes of signal-level (& gain) related distortion
121	10.3 Acoustical and electrical characteristics	174	11.7.4.1 Summing amp overload
121	10.3.1 Pickup patterns	174	11.7.4.2 Power amp overload
121	10.3.1.1 Omnidirectional	175	11.8 Interface with sub-mixers
121	10.3.1.2 Cardioid	178	11.9 Stage monitor mixing consoles
123	10.3.1.3 Bidirectional or figure-8	178	11.9.1 What is a stage monitor system?
123	10.3.1.4 Supercardioid	178	11.9.3 Why a monitor console is preferable to a mix from the main house console
124	10.3.2 Frequency response	179	11.9.4 The importance of a high quality monitor mix
125	10.3.3 Proximity effect	180	11.9.5 Other benefits of a separate monitor console
125	10.3.4 Transient response	180	11.9.6 Polarity (phase) reversal as a tool to fight feedback
126	10.3.5 Output level or sensitivity	181	11.9.7 Eliminating SCR dimmer noise
126	10.3.6 Overload	182	11.10 Microphone splitting
127	10.3.7 Impedance	182	11.10.1 The splitter transformer
127	10.3.8 Balanced and unbalanced connections	183	11.10.2 Additional isolation for high-noise environments
129	10.4 Application information	185	11.10.3 Splitting a mic without a transformer
129	10.4.1 Windscreens and pop filters	186	11.11 Reducing feedback in the stage monitor system
129	10.4.2 Shock mounts	186	11.11.1 Directional microphones
130	10.4.3 Phantom power	186	11.11.2 Polarity reversal (or "phase" reversal)
130	10.4.4 Effect of the number of open microphones	187	11.11.3 Ringing out a monitor system
131	10.4.5 Gain and microphone placement	189	11.11.4 Aiming monitor loudspeakers
131	10.4.6 Stereo recording	189	11.12 Equipment placement
132	10.5 Wireless intercom systems	189	11.12.1 Additional monitor console placement factors
132	10.5.1 What is a wireless intercom?	190	11.12.2 Main house mixing console placement
132	10.5.2 Who uses wireless intercoms?		
133	10.5.3 What is the background of wireless intercoms?		
133	10.5.4 Types of wireless intercoms		
135	10.5.5 Frequencies used		
136	10.5.6 Improved range and noise reduction		
136	10.5.7 Evaluating and selecting a system		
137	10.5.8 Conclusions		
138	10.5.9 Glossary of wireless intercom terms		

Page	Section/Subsection & Title	Page	Section/Subsection & Title
Section 12. Power Amplifiers			
193	12.1 General discussion	269	14.2.8 Analog delay
193	12.2 Ohm's law & related equations	270	14.3 Compressors & limiters
193	12.2.1 Voltage, resistance and current	270	14.3.1 General discussion
194	12.2.2 Electrical power	271	14.3.2 How compressor/limiters work
195	12.2.3 Ohm's law chart	272	14.3.3 Setup adjustments
196	12.2.4 Electrical power and amplifier gain	274	14.4 Noise gates & expanders
197	12.3 Power ratings of amplifiers	274	14.4.1 General
198	12.3.1 FTC preconditioning	275	14.4.2 Noise gate applications
198	12.3.2 Power bandwidth	276	14.4.3 Expander applications
199	12.3.3 Slew rate and output power	277	14.5 Flangers and phasers
200	12.3.4 Bridged operation	277	14.5.1 Flanging
201	12.3.5 The effect of clipping	278	14.5.2 Phasing
202	12.4 The relationship between amplifier power and SPL	278	14.5.3 What to look for
204	12.5 Matching power amplifiers to loudspeakers	279	14.6 Exciters
204	12.5.1 Interpreting loudspeaker power ratings	Section 15. Cabling	
205	12.5.2 Impedance calculations	281	15.1 The importance of good cables
208	12.5.3 Constant-voltage distribution systems	282	15.2 Types of cables, their construction and use
Section 13. Loudspeakers		282	15.2.1 Electrostatic and electromagnetic shielding
209	13.1 Introduction	283	15.2.2 Cable self-capacitance
210	13.2 Common methods of acoustic transduction	284	15.2.3 Single and dual conductor shielded cables
210	13.2.1 Electromagnetic transduction	287	15.2.4 Strain relief
211	13.2.2 Piezoelectric transduction	288	15.2.5 Unshielded cables and speaker cables
212	13.3 Low frequency drivers	289	15.2.6 Multicore audio cables ("snakes")
213	13.3.1 Directional characteristics of cone drivers	291	15.3 Connectors
214	13.4 Low frequency enclosures	291	15.3.1 General
215	13.4.1 Vented enclosures	291	15.3.2 Phone plugs
216	13.4.2 Low frequency horns	297	15.3.3 Phono (pin) connectors
218	13.5 High frequency drivers	299	15.3.4 XLR connectors
219	13.6 High frequency horns	Section 16. Sound System Test Equipment	
222	13.7 Crossovers	303	16.1 The volt-ohm meter
222	13.7.1 General model	305	16.2 The sine wave oscillator
223	13.7.2 Passive, high level crossovers	307	16.3 The oscilloscope
225	13.7.3 Active, low level crossovers	309	16.4 The phase tester
225	13.7.3.1 Headroom	310	16.5 The sound pressure level meter
227	13.7.3.2 Efficiency	311	16.6 The real-time analyzer
227	13.7.3.3 Damping	312	16.7 The loudness monitor
227	13.7.3.4 Distortion	312	16.8 Summary
227	13.7.3.5 Biamp or triamp versus conventional system	Section 17. The Electronics	
228	13.8 Full-range loudspeakers	313	17.1 Basic sound system types
229	13.8.1 Effect of boundary conditions	313	17.1.1 Sound reproduction systems
230	13.9 Loudspeaker specifications	314	17.1.2 Sound reinforcement systems
230	13.9.1 Frequency response	315	17.2 Developing a logical system architecture
231	13.9.2 Power handling	316	17.2.1 Functional grouping
232	13.9.3 Sensitivity	317	17.2.2 System examples
233	13.9.4 Impedance	325	17.3 Basic connections
234	13.9.5 Directional characteristics	325	17.3.1 Signal levels and impedance
236	13.10 Sources of distortion	326	17.3.2 Unbalanced and balanced connections
236	13.10.1 Over-exursion	327	17.4 Grounding
236	13.10.2 Intermodulation distortion	328	17.4.1 Why is proper grounding important?
237	13.10.3 Mechanical defects	329	17.4.2 Ground loops
238	13.11 Typical failure modes	330	17.4.3 Basic grounding techniques
238	13.11.1 Manufacturing defects	333	17.5 Using audio signal transformers
239	13.11.2 Improper operation	333	17.5.1 Properties and functions of signal transformers
241	13.11.3 Failures due to other components in the signal chain	335	17.5.2 Some practical applications
Section 14. Signal Processing Equipment		337	17.6 The main power source
244	14.1 Equalizers	337	17.6.1 Verify the correct mains voltage
244	14.1.1 General discussion	338	17.6.2 Ensure there is a good earth ground
246	14.1.2 Common tone controls	339	17.6.3 How to obtain a safety ground when using a two-wire outlet
248	14.1.3 Multi-band conventional equalizers	339	17.6.4 Improperly wired AC outlets: lifted grounds
248	14.1.4 Sweep-type equalizers	340	17.6.5 Improperly wired AC outlets: lifted neutral
248	14.1.5 Parametric equalizers	341	17.6.6 AC safety tips
251	14.1.6 Graphic equalizers	341	17.6.7 Turn-on sequencing
254	14.1.7 Paragraphic equalizers	341	17.6.8 Power source integrity
254	14.1.8 Tuning a sound system with graphic (or paragraphic) equalization	342	17.7 Configuring equipment racks
256	14.1.9 High pass and low pass filters	343	17.8 Troubleshooting
259	14.2 Reverberation and delay	343	17.8.1 Absence of signal
261	14.2.1 Reverb chambers	343	17.8.2 Undesired signals
262	14.2.2 Duct-type reverbs	Section 18. the loudspeakers	
262	14.2.3 Spring-type reverbs	347	18.1 Analyzing the application
264	14.2.4 Plate-type reverbs	347	18.1.1 The program material
264	14.2.5 Digital reverberation	348	18.1.2 The environment
266	14.2.6 Tape delay	348	18.2 Directional control
267	14.2.7 Digital delay	349	18.2.1 Widening dispersion

Page	Section/Subsection & Title	Page	Section/Subsection & Title
350	18.2.2 Narrowing dispersion	404	20.2.5 Time code and audio tape
351	18.2.3 SPL estimations	404	20.2.5.1 Printing SMPTE time code
351	18.3 Placement considerations	405	20.2.5.2 Copying SMPTE time code
351	18.3.1 Directionality and coverage	405	20.2.6 SMPTE-to-MIDI conversion
353	18.3.2 Feedback control review	406	20.3 Edit decision lists
353	18.3.3 Outdoor sound systems		
354	18.3.4 Controlling feedback indoors		
354	18.3.5 Loudspeaker placement indoors		
355	18.4 Connections		
355	18.4.1 Wire size		
355	18.4.2 Connectors		
357	18.4.3 Polarity of connections		
358	18.4.4 General guidelines		
358	18.5 Setting electronic crossovers		
358	18.5.1 Choice of crossover frequency and slope		
360	18.5.2 Setting up the loudspeaker system		
361	18.5.3 Testing and optimizing the system		
363	18.5.4 High frequency driver protection networks		
364	18.6 Use of fill systems		
368	18.6.1 Balancing fill systems		
368	18.7 Testing and Equalization		
368	18.7.1 Single loudspeakers		
369	18.7.2 Multiple loudspeaker systems		
370	18.7.3 Room equalization		
	Section 19. MIDI		
371	19.1 Interface specifications		
372	19.1.1 Hardware configuration		
373	19.1.2 Data structure		
374	19.1.3 Channel messages		
374	19.1.4 System messages		
375	19.2 Control of musical instruments		
377	19.2.1 MIDI modes		
378	19.2.2 Controllers		
379	19.2.3 Patch editor/librarian functions		
380	19.2.4 MIDI implementation charts		
382	19.3 MIDI sequencing		
382	19.3.1 Basic theory		
383	19.3.2 Channels & tracks		
385	19.3.3 Hardware vs computer-based sequencers		
385	19.3.4 Typical sequencer features		
386	19.3.4.1 Song editing		
386	19.3.4.2 Step editing		
386	19.3.4.3 Common editing features		
387	19.4 MIDI data processors		
387	19.4.1 Thru boxes		
387	19.4.2 MIDI mergers		
388	19.4.3 MIDI patchers		
388	19.4.4 Mapping devices		
388	19.4.5 SysEx data storage		
389	19.5 Automation through MIDI		
389	19.5.1 Instrument patch changes		
390	19.5.2 Signal processors		
390	19.5.3 Console functions		
391	19.5.4 Sync to media		
391	19.6 Troubleshooting		
391	19.6.1 Lack of response		
392	19.6.2 Stuck notes		
392	19.6.3 MIDI feedback		
393	19.6.4 MIDI time delays		
	Section 20. Synchronization		
395	20.1 General discussion		
395	20.1.1 Basic theory		
396	20.1.2 Pulse methods		
397	20.1.3 Timepiece methods		
398	20.2 AMPTW/EBU time code		
398	20.2.1 Signal structure		
400	20.2.2 Frame rates and line references		
401	20.2.3 Longitudinal, vertical interval and visible time code		
402	20.2.4 Machine control		
402	20.2.4.1 Slave code error		
402	20.2.4.2 Slave code offset		
403	20.2.4.3 Flying offsets		
403	20.2.4.4 Slew		
403	20.2.4.5 Advanced transport controls		
403	20.2.4.6 Event triggers		
	Appendix A. Logarithms		
409	A.1 Raising Numbers to a Power: The Key to Logs		
409	A.2 Simple Logs (and Antilogs) to the Base 10		
410	A.3 Less Obvious Logs to The Base 10		
411	A.4 Mathematical Properties of Logs		
412	A.5 One More Look At Logs and Decibels		
	Index		
	Colophon
